

AutoSig Systems, Inc. Releases New Software to Enhance Security and interface to Single Sign On

ATLANTA, GA – JUNE 4, 2018 NEWS RELEASE

AutoSig Systems, Inc. (ASI) of Grayson, Georgia, announces the release of Single Sign On interface for employees. AutoSig has released an API (Application Interface) that allows employees to Sign On to their Network or System one time. The interface then uses the AutoSig security table to determine employee authorizations for use within AutoSig and AutoDoc. This avoids a second sign on or maintenance of separate passwords within AutoSig. The best part is that it picks up the correct security within AutoSig to determine the level of access for the employee.

AutoSig contains robust security to grant exactly the authorization you desire. For example, employees may be authorized for only one location, or one bank within a multibank network. Bank employee information may be segregated to require higher level security or separate security entirely. Bank employees may be restricted to approving transactions only up to a specific dollar amount before a higher level employee is required. Employees may be restricted so that some employees can only view information, while a higher level of employee is required to modify, add or delete information. Lending employees may be restricted as to the function available (such as closing or underwriting) and may also be restricted as to dollar amount of their authorization.

The Single Sign On system or network security will probably be setup to require password changes in a specified time period and may force logoff entirely for inactivity within a short period. The Single Sign On interface from ASI uses the existing network or system security without separate maintenance of these parameters within the AutoSig system.

With so many Black Hat players in the modern world attempting to steal your critical information it is good to know that the system you use to authorize high dollar transactions such as checks and wire transfers has the security that you need to keep out the bad guys.

About AutoSig Systems

ASI is an innovator of image document technology that invents and develops solutions for Signature Identification, Document Imaging, Customer Verification and Fraud Detection for the banking and financial community. For over 40 years, banks and financial institutions have selected our software and services to positively impact their operations and help them better verify critical transactions and store important documents. As an independent and innovative software provider, our Customers never have to change software vendors to incorporate state of the art technology and security. With a history of creating and inventing efficient technology, algorithms and compressions we have set industry standards and perfected the details of image technology. Many of our bank customers say, "it just simply works well." With customer relationships built upon trust, security and the importance of technology, ASI is an ideal partner to deliver your image automation needs when the image counts.
